

Modified Pressure Washer

Description

Low cost, custom modification of a pressure washer used in marine repair. Typically, pressure washers are operated with one hand for prolonged periods of time. Modifying the original handle and adding a second handle may reduce forceful gripping and awkward postures of the wrists. It also divides the weight of the tool, reducing the muscle load of the arms and shoulders. The modified handle can be rested on the worker's thigh when pressure washing the underside of a boat in dry dock, reducing back bending or awkward crouching.

A bar is welded onto the existing handle. The ring attached to the bar is adjustable along the shaft of the bar. The second handle is welded onto the wand of the pressure washer.
